<b>Course Objectives</b>		It is the aim of this course to teach the following topics with in-depth analysis of the chemical principles, beneath the related subjects, and with numerous example problems covering the subject materials in the field of electrometallurgy. To describe the principles and practice of electrometallurgical and other electrochemical processes, which are, or could be, used in the production of metals.				
<b>Course learning outcomes</b>		Upon completion of this course, a student should be able to: 1. have a detailed knowledge and understanding of some of the existing electrometallurgical processes, having learned the underlying principles, 2. have developed skills in analyzing those existing processes which they can also use to conceive and conceptually design novel processes, and 3. be aware of sources of further relevant information.
